

MASS TORT VELOCITY

The Operating System for Mass Tort Law Firms

A Platform Sales White Paper

Intake · Qualification · Case Management · Compliance · Analytics

For Law Firm Leadership & Operations Decision-Makers

01 Executive Summary

Mass Tort Velocity is the purpose-built operating system for mass tort plaintiff law firms — a single integrated platform replacing the patchwork of spreadsheets, generic CRMs, and disconnected intake tools that drain revenue and expose firms to compliance risk. The platform handles every stage of the case lifecycle: TCPA-compliant lead capture, real-time qualification, AI-assisted medical document extraction, paralegal assignment, e-signature dispatch, and predictive portfolio analytics.

50+ Leads per page load, in real time	27+ Voice, SMS, email, fax & AI providers	259 RBAC-secured API routes	25+ Tort campaign forms pre-built	9 Background check lanes per lead
---	---	---------------------------------------	---	---

This white paper is written for firm administrators, managing partners, and operations directors evaluating technology investments. It explains what Mass Tort Velocity does, why it matters financially, and how it compares to building or buying alternatives.

02 The Problem: Why Generic CRMs Fail Mass Tort Firms

Mass tort litigation is not general personal injury. Firms acquire leads in bulk, qualify them against tort-specific medical criteria, manage thousands of open files simultaneously, and face catastrophic compliance exposure if TCPA or HIPAA protocols slip. Generic CRMs — Salesforce, HubSpot, even legal-specific tools built for transactional PI — cannot address these needs without months of expensive customization that never fully delivers.

Pain Point	Typical Impact
Manual lead qualification	2–4 hrs/day per paralegal on triage alone
No cross-channel deduplication	Duplicate records inflate lead costs 15–30%
Spreadsheet-based document tracking	Audit failures and missed filing deadlines
No TCPA consent documentation	Per-call exposure up to \$1,500 (TCPA §227)
Disconnected vendor tools	5–7 vendor logins; integration drift over time
No predictive case scoring	Portfolio blind spots; low-value cases held too long

03 Platform Overview

Mass Tort Velocity is a full-stack, cloud-native platform deployed at **masstortvelocity.com** on an autoscaling infrastructure. A dedicated API server, background job processor, and React-based CRM frontend run as independent services — built for the volume and reliability mass tort firms require.

Lead Intake & Form Engine

TCPA and TrustedForm compliant lead capture for 25+ tort campaigns. Embeddable JS widget for any third-party site. Real-time field validation, cross-channel duplicate detection, and fill-empty deduplication so good data is never overwritten.

AI-Powered Qualification Engine

Deterministic scoring evaluates tort-specific medical criteria first — AI activates only for natural-language tasks. Predictive ML scoring per tort type with confidence intervals. Fraud detection, OFAC sanctions screening, and court record checks run in 9 parallel lanes.

Medical Document Processing

Automated OCR and AI extraction from uploaded medical records. Ambiguous results are flagged for human review — never silently accepted. SHA-256 file integrity verification on every upload.

Case Management & Timeline

Complete lifecycle tracking from intake to settlement. Paralegal round-robin assignment, task queuing, full audit timeline. DocuSign and Dropbox Sign for e-signature dispatch.

Communications Hub

27 integrated providers: voice (5), SMS (6), email (6), fax (5), LLM (11). All credentials in an encrypted vault. Outbound webhooks with HMAC-SHA256 signing.

Analytics & Compliance

Real-time portfolio dashboard: tort breakdown, pipeline trend, paralegal leaderboard, predictive scores. Compliance audit trail with actor attribution and field-level encryption.

Automation Workflow Engine

37-node drag-and-drop builder. AI-assisted creation from plain-language prompts. Triggers on lead events, case status changes, schedules, or inbound webhooks. Full run history.

Security & Access Control

Zero unprotected routes across 259 endpoints. JWT HS256, refresh token rotation, MFA/TOTP, token revocation. Boot-time route matrix audit — server halts startup if any route is unclassified.

04 Return on Investment: The Business Case

The financial case is straightforward. Mass tort firms operate on thin per-lead margins at high volume. Every hour of manual work, every duplicate record, every missed qualification criterion, and every TCPA exposure event directly affects profitability and firm risk.

Value Driver	Mechanism	Conservative Estimate
Paralegal time reclaimed	Automated dedup, AI pre-qualification, doc extraction	8–12 hrs/week per paralegal
Duplicate lead elimination	Cross-channel dedup; fill-empty semantics at intake	15–30% reduction in duplicate spend
TCPA compliance documentation	TrustedForm cert, consent timestamps, immutable audit trail	Eliminates exposure up to \$1,500/violation
Faster qualification cycle	Deterministic scoring + AI extraction; days-to-qualify → hours	20–40% faster case acceptance
Vendor consolidation	27 providers under one vault; replace 5–7 point solutions	\$2,000–\$8,000/mo in savings
Portfolio visibility	Predictive scoring surfaces high-value cases early	5–15% uplift in case quality

"At 1,000 leads/month, a 20% efficiency gain returns 160–240 paralegal hours per month to settlement work — not administrative overhead."

05 Compliance & Security Architecture

Compliance is baked into every data flow — not bolted on afterward.

TCPA & TrustedForm

Every lead capture records TrustedForm certificates, consent language, IP address, and timestamp. Submissions without a valid consent token are refused.

Field-Level Encryption

PII and ePHI encrypted at rest with rotating AES-256 keys, per-field AAD tagging. Key rotation requires no downtime.

Immutable Audit Log

Every state change written to an append-only table with actor attribution. Cannot be edited through the application layer.

Zero Unprotected Routes

42 explicitly public endpoints; 217 RBAC-protected. Boot-time matrix verification halts server startup if any route is unclassified.

MFA & Token Security

TOTP multi-factor, refresh token rotation, real-time revocation, server-side session invalidation with automatic expiry.

OFAC & Fraud Screening

Every lead checked against OFAC sanctions list and fraud engine before acceptance. All results logged with disposition codes.

06 How It Works: Lead-to-Case Lifecycle

1	Capture	Lead arrives via embedded form, API post, or import. TrustedForm cert captured. Dedup check runs — existing record found: update with fill-empty semantics.
2	Qualify	Deterministic scoring evaluates tort-specific medical criteria. 9-lane background hub runs: OFAC, fraud, court records, NPI lookup. Predictive ML score computed.
3	Extract	Medical records enter OCR queue. AI extracts structured clinical fields. Conflicts flagged for paralegal review. SHA-256 hash stored per document.
4	Assign	Qualified lead routed via round-robin or weighted assignment. Task queue created. E-sign packet dispatched via DocuSign or Dropbox Sign.
5	Track	Full case timeline visible to paralegal and supervising attorney. Status changes trigger downstream automations: fax, SMS, case notes.
6	Analyze	Portfolio dashboard: tort breakdown, pipeline velocity, paralegal throughput, predictive scores. Compliance report on demand.

07 Competitive Positioning

Three common alternatives — generic CRM with custom dev, a non-MT legal CRM, or building in-house — each carry significant cost and delivery risk.

Capability	MTV	Generic CRM+Dev	Legal CRM (non-MT)	Build In-House
Mass tort form engine (25+ torts)	✓	6–12 mo	✗	12+ mo
TCPA / TrustedForm native	✓	3–6 mo	Partial	6–9 mo
AI medical document extraction	✓	Vendor+build	✗	12+ mo
27-provider communications vault	✓	Patchwork	✗	N/A
Predictive case scoring	✓	Data sci hire	✗	18+ mo
No-code workflow automation	✓	Zapier	Limited	18+ mo

259-route RBAC audit matrix	✓	Dev effort	Partial	9–12 mo
9-lane background check hub	✓	9 contracts	✗	9–12 mo
Immutable compliance audit log	✓	Custom	Partial	6 mo
Single-vendor contract	✓	5–12 vendors	2–5 vendors	Internal

08 Implementation & Onboarding

Cloud-hosted SaaS. No on-premise installation, no infrastructure procurement, no multi-month project. Firms are fully operational within two weeks.

Phase	Timeline	Deliverable
Kickoff & Configuration	Day 1–3	Firm profile, user roles, tort campaign selection
Form Engine Setup	Day 3–7	Custom intake forms live, embed codes deployed
Provider Vault Integration	Day 5–10	SMS, email, fax, e-sign, LLM providers connected
Data Migration	Day 7–14	Historical leads & cases imported and deduplicated
Staff Training	Day 10–14	Paralegal, admin, and attorney role walkthroughs
Go-Live	Day 14	Full production; dedicated support channel active

09 Technical Foundation

Cloud-Native & Autoscaling

API server and background job processor run as independent autoscaling services. Document processing never blocks API response times.

PostgreSQL + Drizzle ORM

Relational data model with referential integrity. Drift detection on every startup — 49 tables, zero untracked schema differences.

OpenAPI Contract-First

All 259 routes defined in an OpenAPI spec. React Query hooks and Zod schemas auto-generated — frontend and backend cannot drift out of sync.

TypeScript End-to-End

Strict TypeScript across server, worker, and frontend. All external data validated with Zod at every API boundary.

Zero-Trust Security

Every request authenticated and authorized at the route level. Audit logging is non-optional and cannot be bypassed through the application layer.

10 Next Steps

Mass Tort Velocity is available for qualified plaintiff law firms on a subscription basis. All modules included — no per-module up-charging. Pricing scales with monthly lead volume, not seat count.

Schedule a Demo	Request a Pilot	Talk to Sales
Live walkthrough of your firm's workflows	60-day fully managed pilot with your real data	Custom pricing by monthly lead volume
